ARTICLES

Using the Berlin Questionnaire To Identify Patients at Risk for the Sleep Apnea Syndrome 485

N.C. Netzer, R.A. Stoohs, C.M. Netzer, K. Clark, and K.P. Strohl

Although sleep apnea is common, it often goes undiagnosed in primary care encounters. The Berlin Questionnaire was found to be a means of identifying patients who are likely to have sleep apnea.

Antithrombotic Therapy To Prevent Stroke in Patients with Atrial Fibrillation: A Meta-Analysis 492

R.G. Hart, O. Benavente, R. McBride, and L.A. Pearce

Adjusted-dose warfarin and aspirin reduce stroke in patients with atrial fibrillation, and warfarin is substantially more efficacious than aspirin. The benefit of antithrombotic therapy was not offset by the occurrence of major hemorrhage among participants in randomized trials.

Drug Resistance Patterns, Genetic Subtypes, Clinical Features, and Risk Factors in Military Personnel with HIV-1 Seroconversion 502

S.K. Brodine, R.A. Shaffer, M.J. Starkey, S.A. Tasker, J.L. Gilcrest, M.K. Louder, A. Barile, T.C. VanCott, M.T. Vahey, F.E. McCutchan, D.L. Birx, D.D. Richman, and J.R. Mascola

The percentage of HIV-1 non-subtype B infection and mutations resistant to antiretroviral drugs was relatively high in U.S. military personnel with recently acquired HIV-1 infection.

BRIEF COMMUNICATIONS

High-Dose Chemotherapy and Syngeneic Hemopoietic Stem-Cell Transplantation for Severe, Seronegative Rheumatoid Arthritis 507

G. McColl, H. Kohsaka, J. Szer, and I. Wicks

A patient with severe, treatment-resistant rheumatoid arthritis received high-dose cyclophosphamide and antithymocyte globulin. Hemopoietic rescue was achieved with peripheral blood stem cells from the patient's identical twin brother.

Long-Term Sequelae of Spontaneous Axillary-Subclavian Venous Thrombosis 510

E. Héron, O. Lozingue, J. Emmerich, C. Laurian, and J.-N. Fiessinger

The overall clinical outcome of spontaneous axillary-subclavian venous thrombosis is good, and no relation exists between the severity of late symptoms and ultrasonographic sequelae.

UPDATE

Update in Psychiatry 514

R.K. Schneider and J.L. Levenson

In covering the pertinent psychiatric literature published in 1998, this Update expands on and introduces information about psychiatry that may not be readily available to the general clinical internist.

NIH CONFERENCE

The Stiff-Person Syndrome: An Autoimmune Disorder Affecting Neurotransmission of γ -Aminobutyric Acid 522

L.M. Levy, M.C. Dalakas, and M.K. Floeter

The stiff-person syndrome is characterized by muscle rigidity and episodic spasms that involve axial and limb muscles. Although the cause is unknown, an autoimmune pathogenesis is suspected. The syndrome is potentially treatable by immunomodulatory agents.

PERSPECTIVE

Diagnosing Suffering: A Perspective 531

E.J. Cassell

The diagnosis of suffering is often missed, even in severe illness and even when it stares physicians in the face. Knowing patients well enough to understand the origin of their suffering and its best treatment requires methods of empathic attentiveness and nondiscursive thinking that can be learned and taught. The relief of suffering depends on physicians acquiring these skills.

Do You Ever Take a Sleep History?	535	<i>P.P. Mortimer</i>	
<i>R.P. Millman</i>		Misdiagnosis of HIV Infection	546
In this issue, Netzer and colleagues' well-designed study shows that a simple self-administered patient questionnaire is an excellent way of identifying patients at high risk for sleep apnea. The study also provides further evidence that physicians underrecognize sleep disorders.		<i>W. Palmas; C. Goodman, W. Emmons, and J. Newton; J.D. Rich, E. Mylonakis, and T.P. Flanigan</i>	
Atrial Fibrillation: The Epidemic of the New Millennium	537	Myocardial Infarction in HIV-Infected Men Receiving Protease Inhibitors	548
<i>M.D. Ezekowitz</i>		<i>T.E. Flynn and L.A. Bricker</i>	
Hart and colleagues' meta-analysis in this issue reemphasizes the value of anticoagulation in patients with atrial fibrillation, especially those at highest risk for stroke. These findings may lead to increased use of antithrombotic therapy in elderly patients, who have the greatest risk for stroke but also are a group for whom the fear of bleeding complications with anticoagulation is greatest.
