ARTICLES

Effectiveness of Manual Physical Therapy and Exercise in Osteoarthritis of the Knee. A Randomized, Controlled Trial 173

G.D. Deyle, N.E. Henderson, R.L. Matekel, M.G. Ryder, M.B. Garber, and S.C. Allison

A combination of manual physical therapy and supervised exercise yields functional benefits for patients with osteoarthritis of the knee and may delay or prevent the need for surgical intervention.

Epidemiologic Relation between HIV and Invasive Pneumococcal Disease in San Francisco County, California 182

J.P. Nuorti, J.C. Butler, L. Gelling, J.L. Kool, A.L. Reingold, and D.J. Vugia

In a community with a high prevalence of HIV infection, much of the burden of pneumococcal disease was attributable to AIDS. Incidence rates were high in young adults and especially in black persons. Efforts to increase pneumococcal vaccination rates should target HIV-infected adults, particularly those living in poor urban areas.

Resource Use and Survival of Patients Hospitalized with Congestive Heart Failure: Differences in Care by Specialty of the Attending Physician 191

A.D. Auerbach, M.B. Hamel, R.B. Davis, A.F. Connors Jr., C. Regueiro, N. Desbiens, L. Goldman, R.M. Califf, N.V. Dawson, N. Wenger, H. Vidaillet, and R.S. Phillips, for the SUPPORT Investigators

In this observational study of patients hospitalized with congestive heart failure, cardiologist care was associated with greater costs and resource use and no difference in survival at 30 days of follow-up compared with generalist care. Whether the trend toward better survival at 1-year follow-up represents differences in care or unadjusted illness severity is uncertain.

BRIEF COMMUNICATIONS

Discontinuation of Chemoprophylaxis against *Pneumocystis carinii* Pneumonia in Patients with HIV Infection 201

B.G. Yangco, J.C. Von Bargen, A.C. Moorman, and S.D. Holmberg, for the HIV Outpatient Study (HOPS) Investigators

Discontinuing prophylaxis against *Pneumocystis carinii* pneumonia may be appropriate for some HIV-infected ambulatory patients.

Evidence of Zoonotic Transmission of *Cryptococcus neoformans* from a Pet Cockatoo to an Immunocompromised Patient 205

J.D. Nosanchuk, S. Shoham, B.C. Fries, D.S. Shapiro, S.M. Levitz, and A. Casadevall

An immunocompromised woman who owned a pet cockatoo developed cryptococcal meningitis. The patient and the cockatoo had indistinguishable isolates and biochemical patterns, a finding suggesting that the patient's infection resulted from exposure to aerosolized cockatoo excreta.

ACADEMIA AND CLINIC

Assessing and Managing Depression in the Terminally Ill Patient 209

S.D. Block, for the ACP-ASIM End-of-Life Care Consensus Panel

Psychological distress often causes suffering in terminally ill patients and their families and poses challenges in diagnosis and treatment. This paper uses three cases to illustrate the assessment and management of normal distress and grieving, clinical depression, and the wish to hasten death in the presence of psychological distress.

UPDATE

Update in Allergy and Immunology 219

M.T. O'Hollaren

Areas explored in this Update are asthma, rhinitis treatment, allergen immunotherapy, epinephrine treatment of anaphylaxis, and the appropriate duration of prophylaxis against anaphylactic reactions to insect stings.

REVIEW

Sensitivity and Specificity of Helical Computed Tomography in the Diagnosis of Pulmonary Embolism: A Systematic Review 227

S.W. Rathbun, G.E. Raskob, and T.L. Whitsett

Use of helical computed tomography (CT) in the diagnosis of pulmonary embolism has not been adequately evaluated. The safety of withholding anticoagulation in patients with negative findings on helical CT is uncertain. Definitive large, prospective studies should be conducted to assess the sensitivity, specificity, and safety of helical CT for diagnosing suspected pulmonary embolism.

PERSPECTIVE	
The Diastolic Blood Pressure in Systolic Hypertension 233 <i>H. Smulyan and M.E. Safar</i> Normal or low diastolic blood pressure is the characteristic that makes isolated systolic hypertension clinically different from essential hypertension. The elevated systolic pressure requires therapy, but large reductions in cuff diastolic pressures, especially in patients with known coronary artery disease, should probably be avoided. EDITORIALS	
Congestive Heart Failure: Who Should Provide Care? 238 <i>D.L. Morris and D.F. Petrucci</i> In this issue, Auerbach and colleagues report that care by cardiologists may be associated with a marginal survival benefit but is also associated with higher costs and greater resource utilization. However, without information on appropriateness of care, the reason for cost differences and resource utilization cannot be attributed to overuse of resources by cardiologists or underuse of resources by generalists.	
Helical Computed Tomography and the Diagnosis of Pulmonary Embolism 240 <i>S.M. Bates and J.S. Ginsberg</i> Rathbun and colleagues' systematic review in this issue evaluates prospective studies on helical computed tomography (CT) for diagnosing pulmonary embolism. The authors correctly conclude that helical CT has not been adequately assessed for the diagnosis of pulmonary embolism. The role of this new technology remains controversial, and further studies are needed.	
	Cardiology Textbooks on Disk 248 <i>C.H. Scott</i> Three CD-ROM versions of textbooks are reviewed: Braunwald's <i>Heart Disease: A Textbook of Cardiovascular Medicine</i> , Topol's <i>Cardiovascular Medicine</i> , and Hurst's <i>The Heart</i> .
